ICON-ART running in “EnVar” mode

2018040800, vv: 003, ICON-ART, AOD_DUST

- spatial resolution: 26 km (global)
13 km (nest, ICON-EU-NA-NA)
- since December 2017:
Daily 00 and 12 UTC forecasts up to
+180 h (global), +120 h (nest)
- two long running experiments in “EnVar” mode:
 - **with prognostic mineral dust**
(quasi-operational mineral dust forecasts)
 - with Tegen et al. (1997) dust climatology
(control experiment, similar to operational ICON)
- data delivery to meteocontrol, KIT, [WMO-SDS-WAS](#)
(Sand and Dust Storm Warning Advisory and Assessment System)

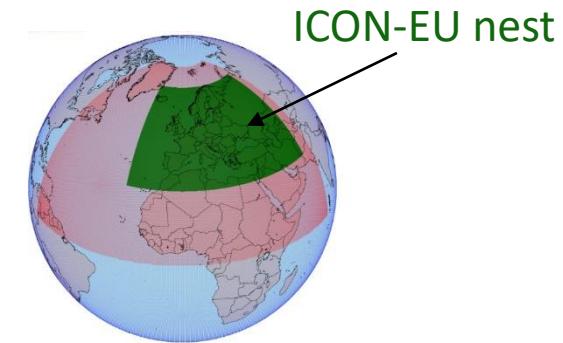

PLANNED OPERATIONAL SETUP FOR ICON-ART AT DWD

Gefördert durch:
Bundesministerium
für Wirtschaft
und Klimaschutz
aufgrund eines Beschlusses
des Deutschen Bundestages

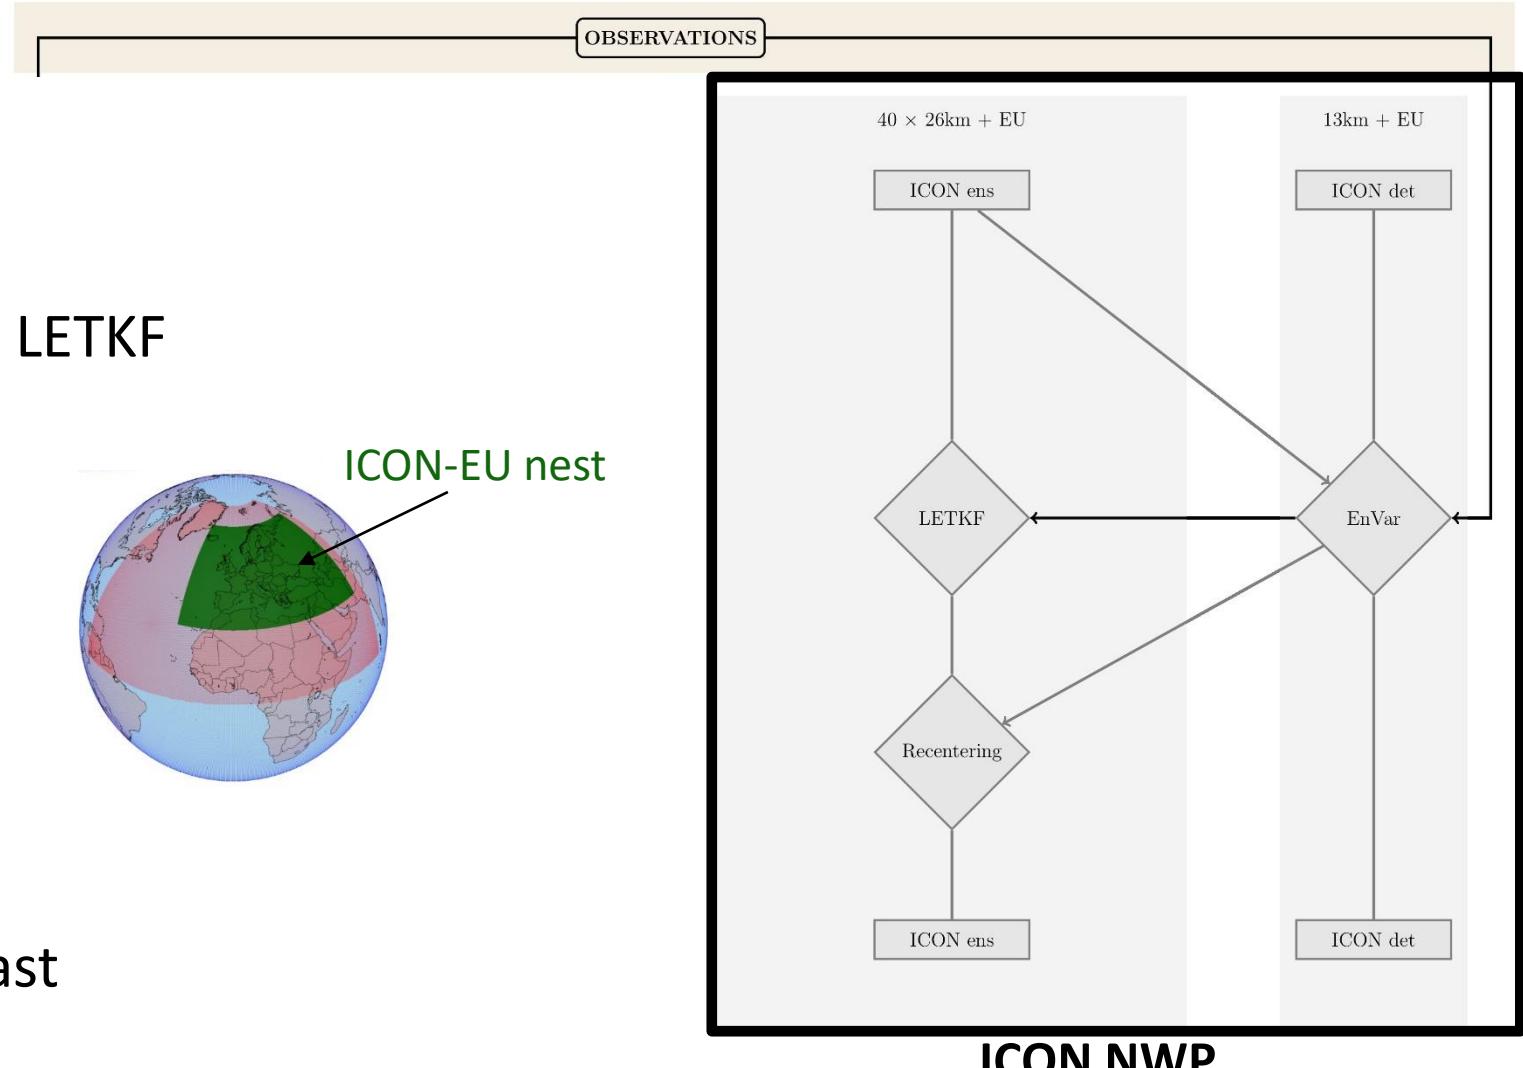

EnVar:

- Initial data for forecasts
- Observation quality control for LETKF

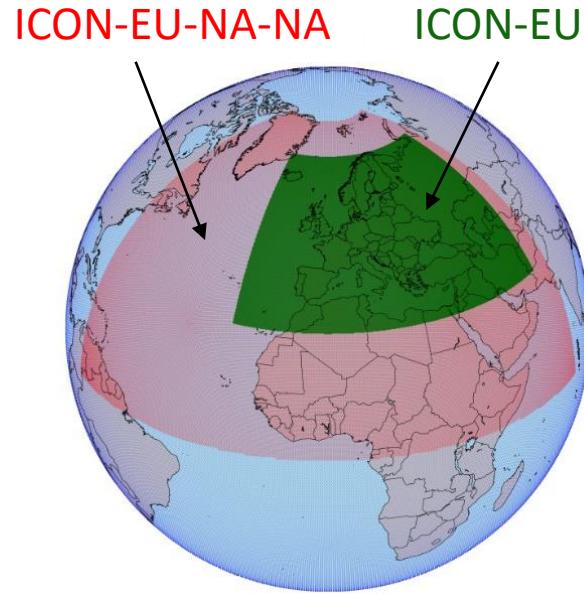

LETKF:

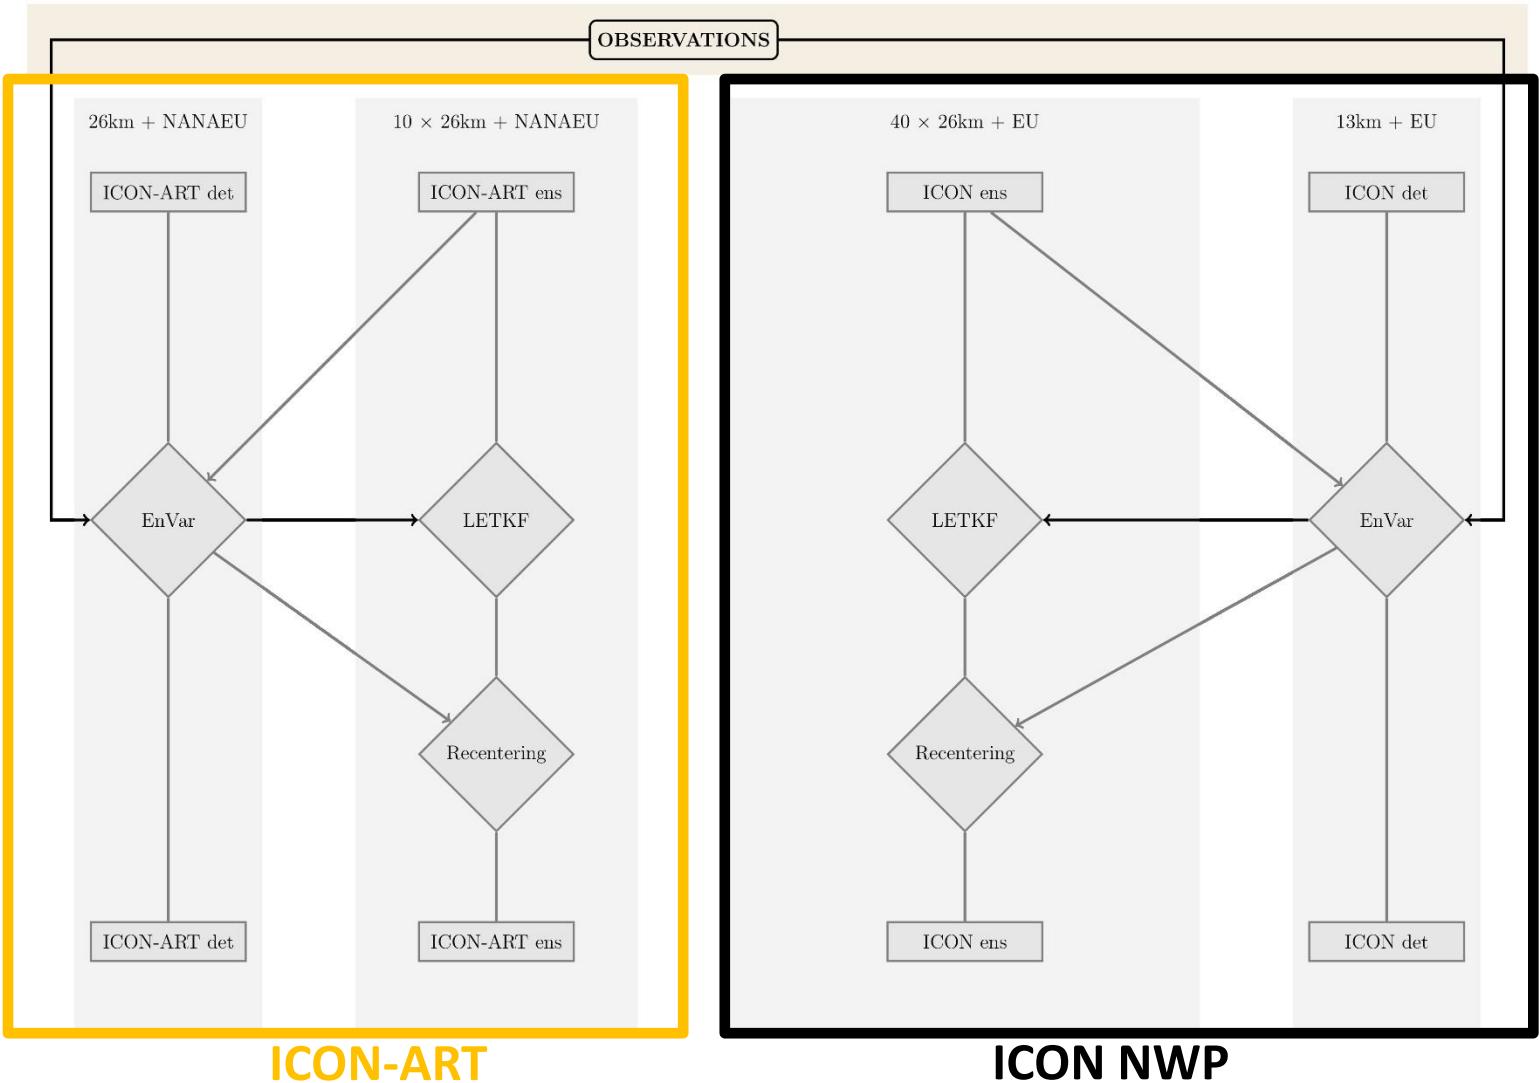

- Dynamical information for deterministic data assimilation
- Initial data for ensemble forecast

EnVar and LETKF DA - two systems

- 2nd smaller ensemble
- 2nd deterministic run
- 2nd system includes prognostic mineral dust forecasts

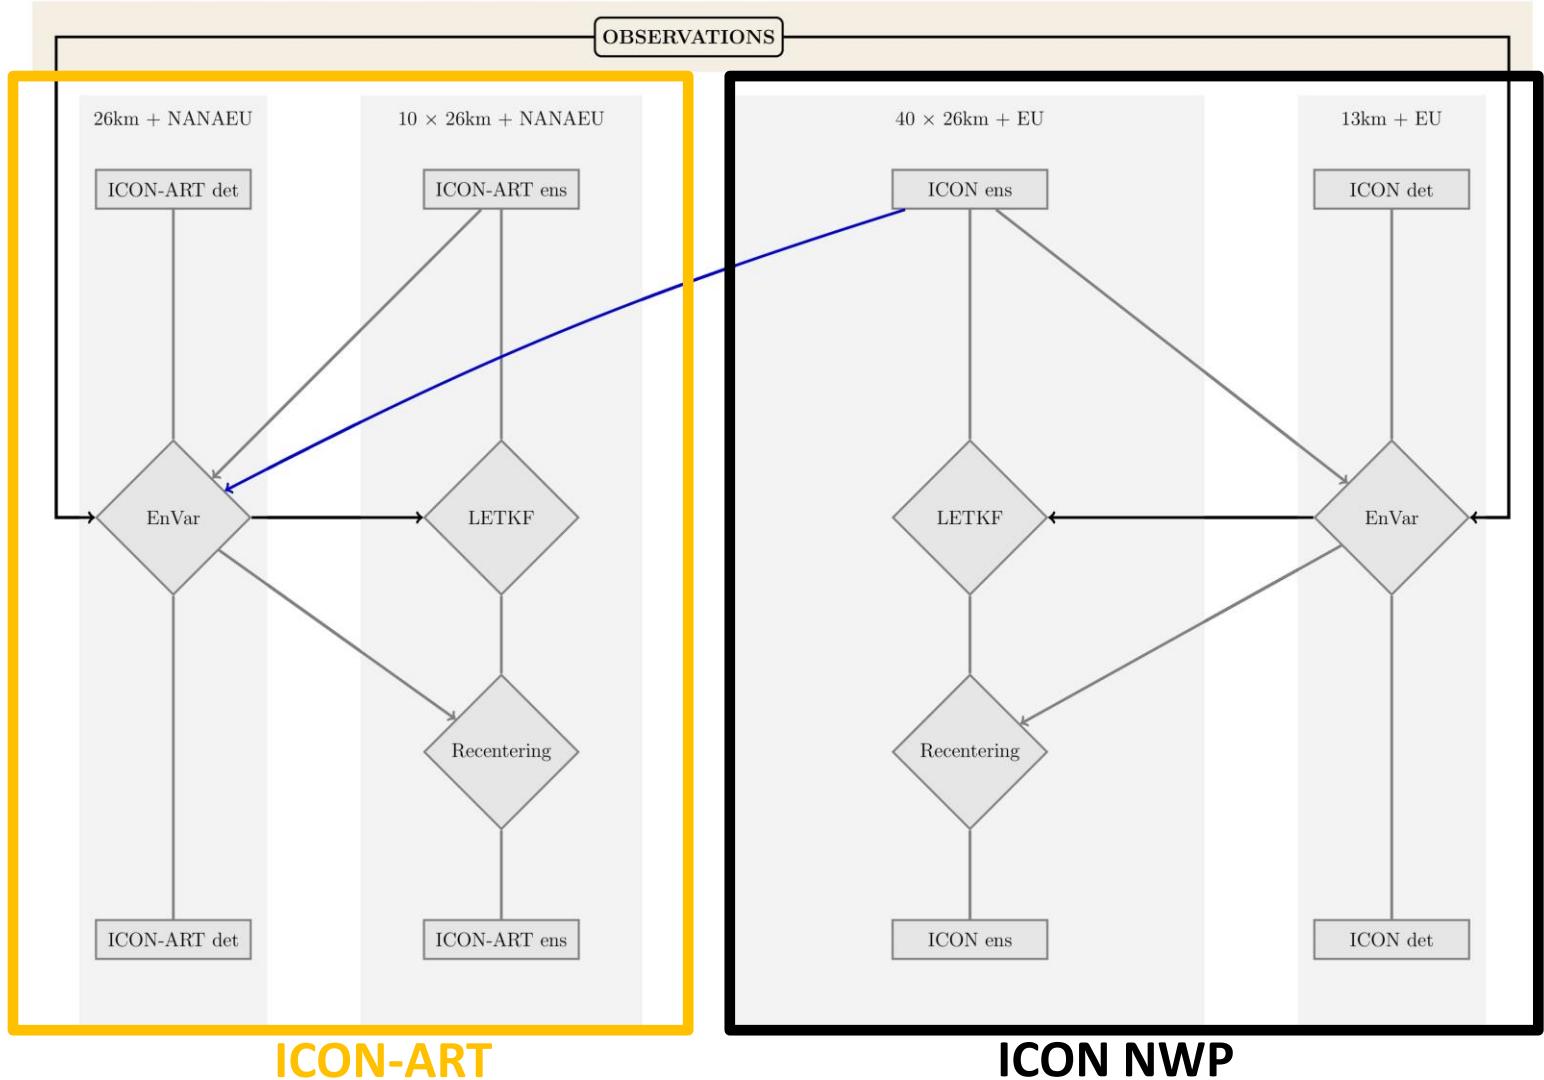

Gefördert durch:
Bundesministerium
für Wirtschaft
und Klimaschutz
aufgrund eines Beschlusses
des Deutschen Bundestages

Planned operational DA setup at DWD (Q4 2023)

Combine ICON and ICON-ART ensembles in data assimilation for ICON-ART:

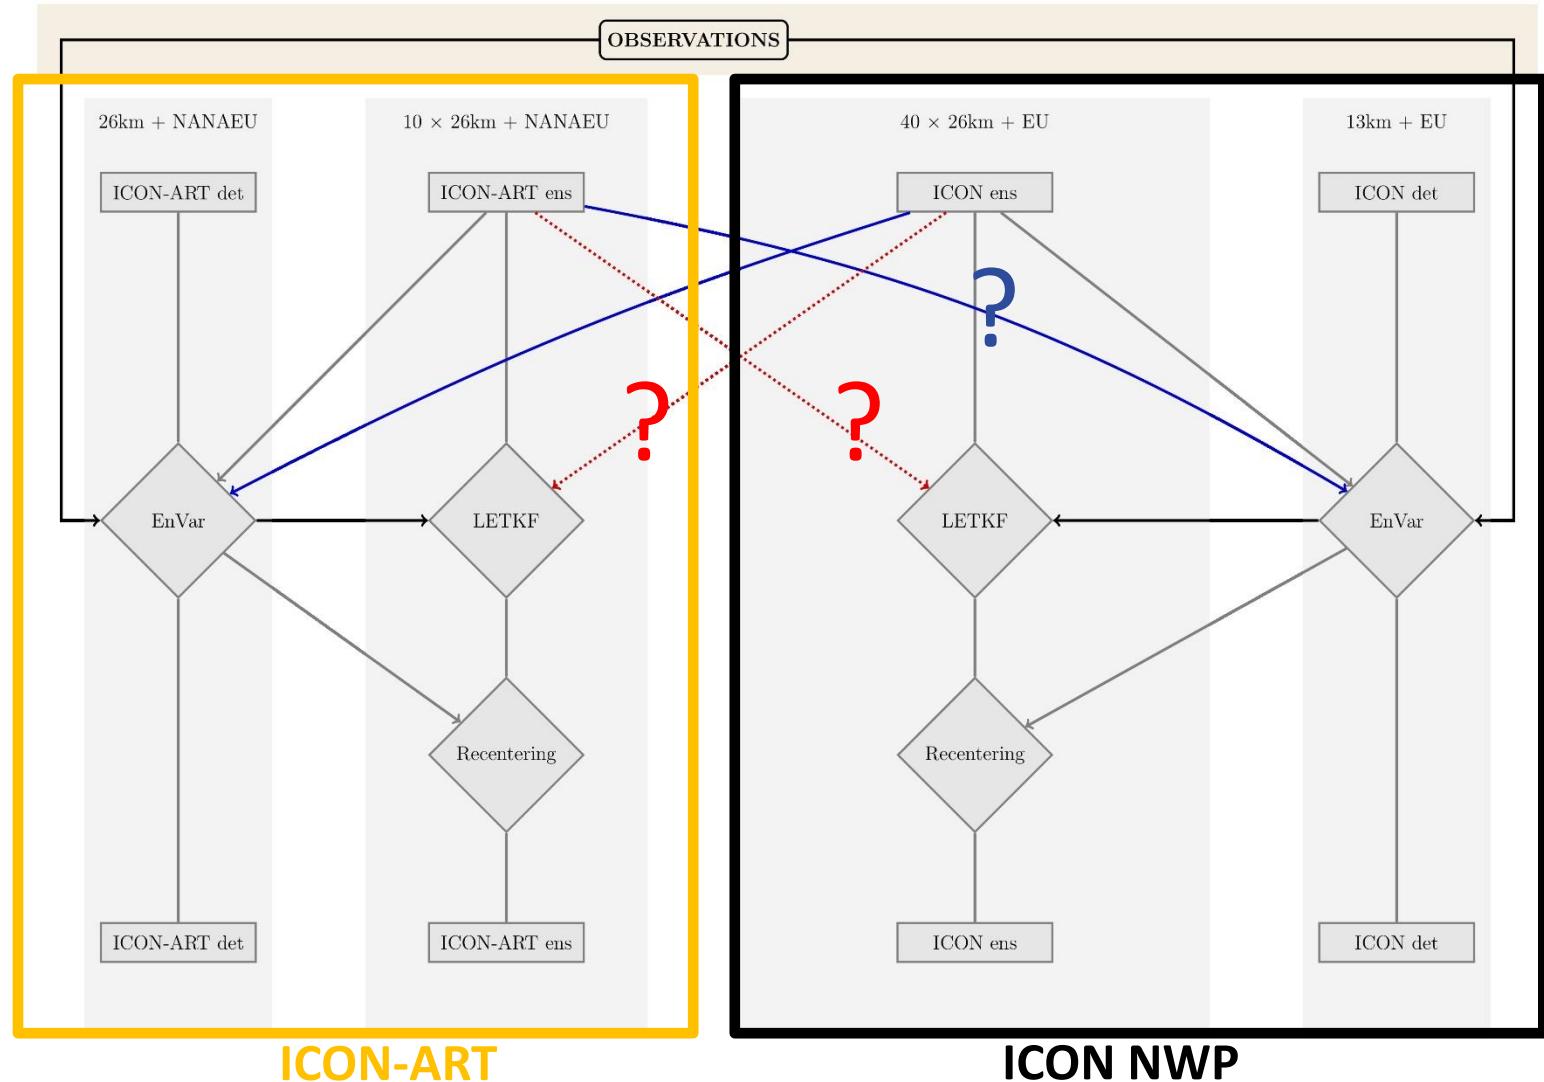

- Bigger ensemble in EnVar data assimilation (→)

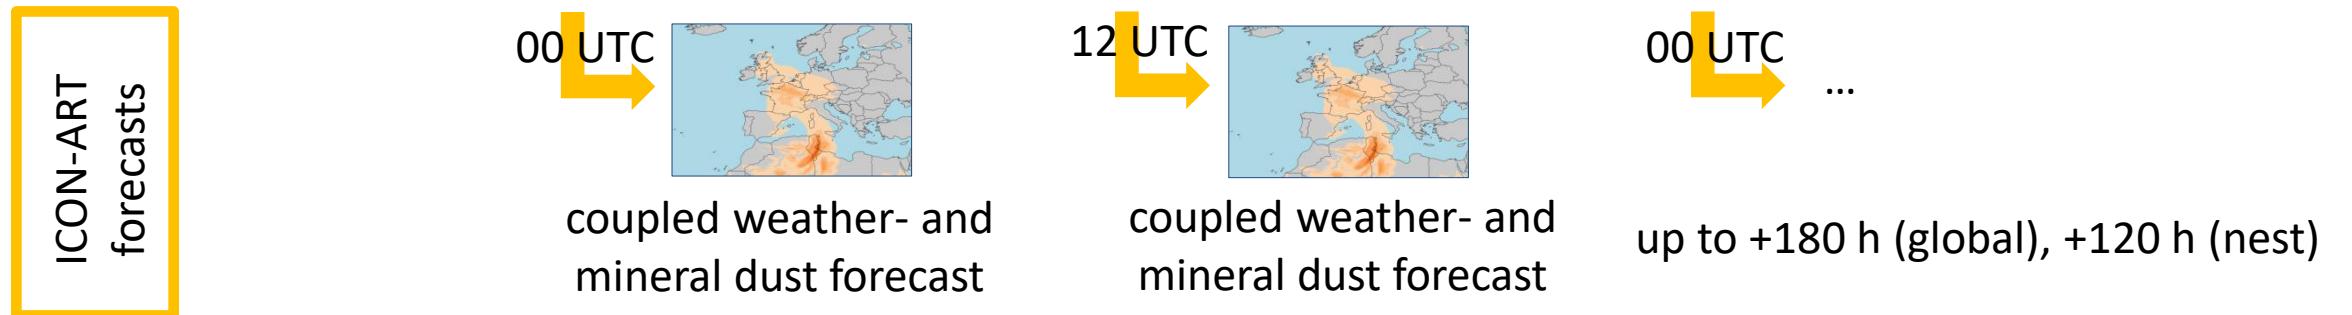

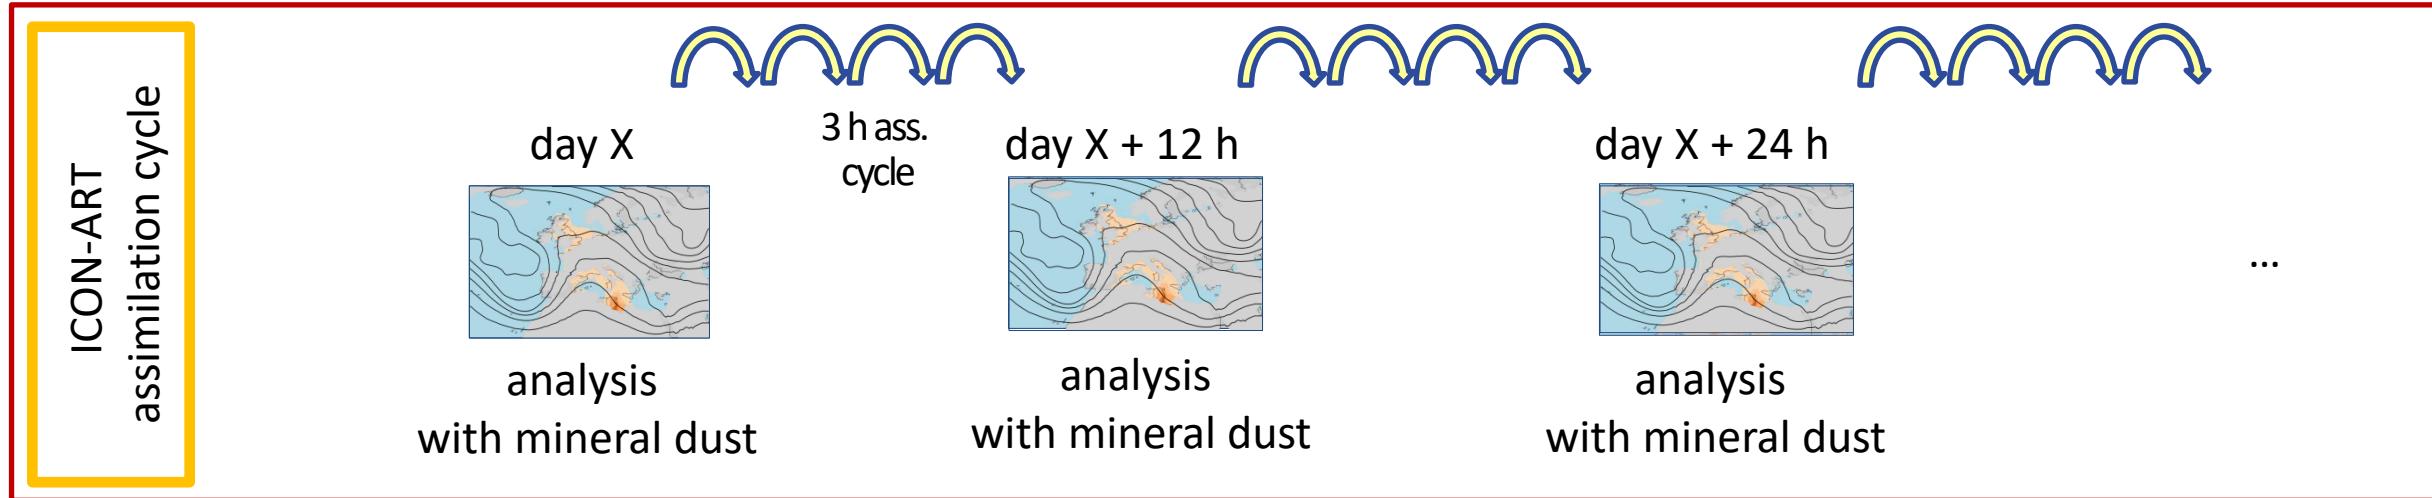

Possible future operational DA setup at DWD

Combine ICON and ICON-ART ensembles in data assimilation for ICON-ART:

- Bigger ensemble in EnVar data assimilation (→)
- Outlook: Optionally bigger ensemble in LETKF data assimilation (..... →)
- ?/? Maybe later ...

Plan: operational ICON-ART forecast at DWD (26/13 km)

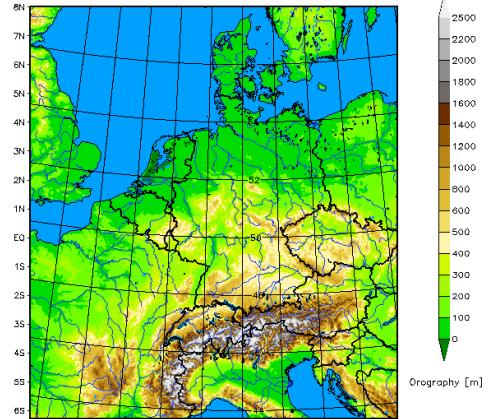

first guess forecasts in the assimilation cycle are ICON-ART forecasts with prognostic mineral dust, including the interaction with the atmosphere.

Dusty cirrus case of 21 April 2020

- A "dusty cirrus" is an extended cirrus cloud deck with cellular structure associated with a Saharan dust event.
- It has been speculated that the dusty cirrus forms due to longwave cooling at the dust layer (Kollath 2010).
- ICON-ART does predict mineral dust at the location of the “dusty cirrus”

Radiosonde comparison for Payerne, 16 March 2022 11 UTC

Deutscher Wetterdienst
Wetter und Klima aus einer Hand

100 $\mu\text{g m}^{-3}$ normalized dust modes A, B, C in dashed lines

IR Cloud and visible reflectance of SEVIRI and ICON-ART

- Moist „anomaly“ in observed profile, 10 K error in dew point T in 300 hPa in ICON
- Cirrus layer is located above the dust, not in the dust layer

Dusty cirrus: revised conceptual model and parameterization

dusty dry air
 $RH_i < 100\%$

LW cooling at the dust layer could play a role to initiate ice nucleation at the interface, but other than it seems unnecessary to explain the formation of the cloud layer.

A simple empirical threshold-based parameterization for a sub-grid dusty cirrus:

Mass concentration of mineral dust c_{mode} with mode $\in \{\text{dustA}, \text{dustB}, \text{dustC}\}$

Ice saturation ratio $s_{ice} = p_v/p_{sat,ice}$

Temperature lapse rate

$$\Gamma_k = \frac{\partial T}{\partial z} \Big|_k \approx \frac{T_k - T_{k+1}}{\Delta z}$$

Dusty cirrus occurs in model level k if the following conditions are fulfilled:

$$T_k < 240 \text{ K}$$

$$c_{dust,k}^* = \max_{j=k+1}^{k+N} (c_{dustB,j} + 2 c_{dustC,j}) > 50 \mu\text{g kg}^{-3}$$

$$s_{ice,k}^* = \max_{j=k}^{k+N} s_{ice,j} > 0.7$$

$$\Gamma_k^* = \min_{j=k}^{k+1} \Gamma_j < -6.5 \text{ K km}^{-1}$$

with $N = 4$ corresponding to a vertical depth of approximately 1500 m.

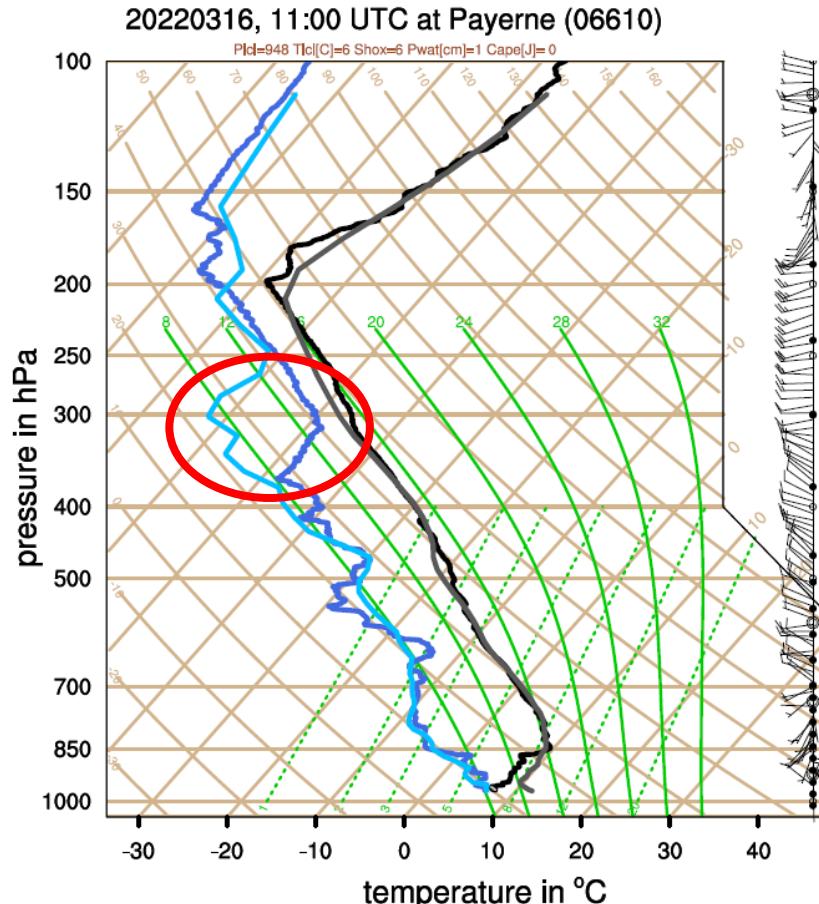

Most surprising is the very low RH_i threshold to initiate the cirrus formation.

SUMMARY AND OUTLOOK

Gefördert durch:
Bundesministerium
für Wirtschaft
und Klimaschutz
aufgrund eines Beschlusses
des Deutschen Bundestages

Summary

- ICON-ART with prognostic mineral dust quasi-operational at DWD since Dec. 2017
- ICON-ART ensemble experiments, combination of ICON-ART and ICON ensemble
- ICON-D2-ART with “Dusty Cirrus” parameterization

Outlook

- ICON-ART with prognostic mineral dust soon operational (plan: Q4 2023)
- ART parameter perturbations in ICON-ART ensemble
- “Dusty Cirrus” parameterization in global experiments
- additional aerosol types sea salt and biomass burning aerosol in quasi-operational experiments
